Lecture 24 — Reliability: Fail-Soft Operation

Jeff Zarnett jzarnett@uwaterloo.ca

Department of Electrical and Computer Engineering University of Waterloo

April 7, 2024

MTE 241 Spring 2024 1/31

Things Go Wrong

Except when we just talked about hard drives, we usually think that things will work as they should.

MTE 241 Spring 2024 2/31

Reliability Required?

Downtime is okay for some systems: e.g., my laptop!

Reliability is important for real-time systems...

Downtime may be intolerable if it's life- or safety-critical!

Or maybe it just costs money if you have some SLA.

MTE 241 Spring 2024 3/31

In French, Le Flat Tire

Normally, if I get a flat tire, I can't drive until I change the tire.

Run-flat tires have limitations, but the car is functional at reduced capacity.

MTE 241 Spring 2024 4/31

Two distinct goals:

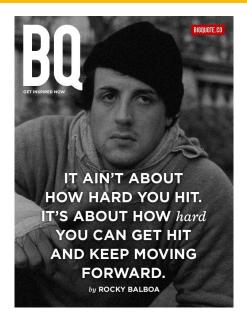

1. Resiliency – carry on in the event of a failure.

2. Fail-soft – preserve as much capability as possible or terminate gracefully.

Where did RAID fall in this spectrum?

MTE 241 Spring 2024 5/31

Resiliency

MTE 241 Spring 2024 6/31

Resiliency Requirements

First question is how much resiliency you really need?

Is this "we lose money" or "people might die"?

MTE 241 Spring 2024 7/31

But no need to plan for nuclear armageddon (usually).

MTE 241 Spring 2024 8/31

This is an engineering design tradeoff: how much extra capacity should we have?

∠ DEPARTURES			
TIME	DESTINATION	FLIGHT	GATI
12:39	LONDON	BA 903	31
12:57	SYDNEY	QF5723	27
13:08	TORONTO	AC5984	22
13:21	T0KY0	JL 608	41
13:37	HONG KONG	CX5471	29
13:48	MADRID	IB3941	30
14:19	BERLIN	LH5021	28
14:35	NEW YORK	AA 997	11

Too little capacity: every problem becomes global...
Too much and we wasted money!

MTE 241 Spring 2024 9/31

Can We Fix It? Yes We Can!

Best option for resiliency is to fix it!

Maybe not possible if this is an unrecoverable hardware failure.

Maybe deadlock detection and recovery?

MTE 241 Spring 2024 10/31

Continue as best we can at reduced capacity.

MTE 241 Spring 2024 11/31

Stiff Upper Lip

Example: 4 CPU cores, all running at 50% capacity, but one dies?

Maybe running at reduced capacity until a repair comes...

What if we can't meet all deadlines?

MTE 241 Spring 2024 12/31

Real-Time Resiliency

The system is considered stable if it will always meet the deadlines of its most critical tasks.

Even if lower priority tasks may not be completed at all!

Painful choices may need to be made.

MTE 241 Spring 2024 13/31

Shut It Down!

Perhaps it's sensible to do an orderly shutdown.

Prevent data corruption, but cannot carry on.

MTE 241 Spring 2024 14/31

Stop. Hammertime.

Cease all operation or execution immediately.

This may cause some damage, but may be the least bad choice.

MTE 241 Spring 2024 15/31

Faults and Fault Tolerance

Until now, vague words about "something going wrong".

What is a fault and failure?

MTE 241 Spring 2024 16/31

Faults and Fault Tolerance

Failure: When the response (outcome) deviates from the specification as a result of an error.

Error: A manifestation of a fault.

Fault: An erroneous hardware or software state of some variety.

MTE 241 Spring 2024 17/31

Types of Fault

Permanent: dead hard drive, software bug.

Intermittent: fault hardware chip.

Transient: cosmic radiation?

MTE 241 Spring 2024 18 / 31

Instead of jumping right to fault tolerance, what about prevention?

What strategies would you use?

MTE 241 Spring 2024 19 / 31

Not Perfect

Following appropriate design, implementation, and testing processes will only make faults less likely.

It is also important to resist the pressure to drop or degrade these processes when user time pressure.

Still need to think about tolerance...

MTE 241 Spring 2024 20/31

Fault Tolerance

We already know a few things about fault tolerance from earlier topics.

Can you think of some?

MTE 241 Spring 2024 21/31

Fault Tolerance Techniques

- Process Isolation
- Dual-Mode Operation
- Preemptive, Priority-Based Scheduling
- Checkpoints, Transactions, Rollback
- RAID
- Checksums, Parity Bits, ECC...

MTE 241 Spring 2024 22/31

Types of Redundancy

Information redundancy: checksums, parity bits, ECC...

Physical redundancy: two CPUs instead of one...

Temporal redundancy: TCP communication, resend...

MTE 241 Spring 2024 23/31

Space Shuttle

The Space Shuttle had both physical and temporal redundancy.

Important thing: no single point of failure!

MTE 241 Spring 2024 24/31

Now I Have Two Problems

We covered this a little bit in the Byzantine Generals Problem.

We'll consider one in particular: clock synchronization.

MTE 241 Spring 2024 25/31

Clock Synchronization

It is not trivial to get two independent systems to agree on what time it is.

Inevitably, all clocks except the universal reference clock are off by some amount; it's just a question of how much!

MTE 241 Spring 2024 26 / 31

Disagreement Means Problems

It's easy to imagine scenarios where independent systems who don't agree on what time it is will misbehave.

Ever been in a video call with lag?

Time zones also matter!

MTE 241 Spring 2024 27/31

Quartz Clocks

Clocks frequently use quartz for synchronization, but there is always drift and measurement error.

A quartz clock will typically vary by about half a second per day, so the idea of systems being off by a full second is quite reasonable.

Just imagine System A is fast by 0.5s and System B is slow by 0.5s.

MTE 241 Spring 2024 28 / 31

Time Travel is Real

In a non-real time operating system, it's often okay to just change the clock to the correct time and just jump there.

But for a real-time system, breaking the expectation of linear time can cause events to run again, so typically we do not wish to do that.

The solutions are effectively a graduated slowdown or speedup... but to when?

MTE 241 Spring 2024 29 / 31

A possible solution is something like the Network Time Protocol.

Effectively, it's difficult or impossible to get more than one system to agree on what time it is.

Better: build your system to account for these things.

MTE 241 Spring 2024 30/31

Distributed Systems Course

All of this is just a very simple overview of some of the issues that might arise when we have multiple systems for redundancy.

This is a complicated subject and is a whole 4th year ECE technical elective that you could take!

MTE 241 Spring 2024 31/31
